

Executive Summary: Netflix Content Strategy Analysis

Analyst: Umar Aishat (Statistics Graduate, BUK)

Project: AnalystLab Africa – Week 2 Deliverable

Date: May 12, 2026

1. Project Overview

The objective of this project was to clean, structure, and analyze the Netflix global titles dataset (8,807 records) to identify catalog composition and content acquisition trends. Using Python (Pandas/Seaborn), the raw data was transformed into a verified "Source of Truth," enabling a clear visualization of how the platform has scaled its library over the last decade.

2. Data Quality & Integrity Actions

To ensure the purity of the statistical analysis, the following data governance steps were implemented:

- **Categorical Imputation:** Addressed over **2,600 missing entries** in the director, cast, and country columns by applying logical placeholders ("Unknown"), preserving the dataset's volume for secondary analysis.
- **Temporal Normalization:** Standardized the date_added column into a proper datetime format. Ten records with missing dates (<0.1% of data) were removed to ensure the integrity of the growth timeline.
- **Feature Engineering:** Extracted a new variable, year_added, to facilitate year-over-year trend analysis, moving beyond raw data into descriptive modeling.
- **Statistical Imputation:** Resolved minor gaps in rating and duration using the **Mode** (most frequent value), ensuring the distribution remained consistent with the majority of the population.

3. Key Business Insights

- **Catalog Composition (Movies vs. TV):** The library is heavily weighted toward **Movies (69.7%)**. This indicates a strategy focused on a wide variety of "one-time" viewership assets to cater to diverse global tastes.
- **The 2016 Growth Pivot:** Time-series analysis identifies 2016 as a major inflection point. Content acquisition surged exponentially between 2016 and 2019, marking Netflix's aggressive shift toward "Originals" and global market dominance.
- **Production Hub Dominance:** While the **United States** remains the primary content source, **India** was identified as the second-largest contributor. This highlights the critical importance of the South Asian market in Netflix's international expansion strategy.
- **Primary Market Focus:** The "Top 10 Countries" visual confirms that English-speaking and Asian markets (India, UK, Canada, Japan) drive the bulk of the platform's production, providing a clear roadmap for localized marketing efforts.

4. Conclusion & Recommendation

The dataset is now optimized for deeper analysis, such as genre-clustering or sentiment analysis of descriptions. It is recommended that Netflix continues to diversify its production hubs in emerging markets like South Korea and Spain, which are already showing strong upward trends in the Top 10 rankings.
